

6 JOINER TRANSFORMATION

{ FLAT FILE TESTING }

Joiner transformation is used to join two sources coming from two different location or from same location.

For example : To join a flat file and relational source (Table) and then load into target.

Ex-2 : To join two different flat files and then load into target.

SOURCE :

Sometimes as a tester we can not access the data directly therefore client will move the particular data in required table format or files. source file name they can give as trans_Todays date. file name { i.e trans_210921.csv. After loading the data into source file ETL support team will check the data. If the data is in required file, if the delimiters
